

Power Mirror Installation Guide

Warning: We recommend that you have a professional installer to do this job for you if you don't have any **ELECTRICAL** experience before!!

At the plug where your Factory Power unit was plugged into, test with a logic probe or power probe, which wire has 12 volts on when you adjusting left. This is the wire that you will need to connect the **RED** wire then find the ground wire (connect to the **BLACK** wire) for it from the factory harness. When you adjusting to the right, those **RED** and **Black** wire should be reversed. Repeat the last step again for up/down and then connect the **WHITE** wire to it.

For the LED light that use as turn signal option, you will need to get a **RELAY** kit for easier installation without damage/affect factory wiring harness.

TIP: Many power units have a plug that you can cut off and wire to your new power unit so you can plug it directly into the factory plug. Use this method if has a plug that you can cut off.

Left mirror: Red- Up, White- Right
Right mirror: Red- Left, White- Down
